APPLICATION REVERT IN SUPER PORTAL

FEATURE OVERVIEW

This document describes the Super Portal **Application Revert** capability which allows authorised bank staff to return a **rejected** application to the queue it was rejected from, so that the responsible team can correct the credit parameters and re-decision the case without the customer reapplying. Once an application is rejected, the pre-dedupe *Existing Application Check* blocks any new application for the same customer for **30 days** — reverting the same application is the only remedy inside that window. The capability complements the existing Application Cancellation function and follows the same maker–checker governance. Key steps are as following:

- Bank user with '**Revert Application**' permission initiates the revert request from Application Enquiry, with a mandatory Revert Reason.
- Revert Queue user with 'Evaluate Application' permission approves or rejects the request within a configurable time window.
- If no decision is made within a configurable timeout period, the request is **auto-approved by the System** — the same timeout behaviour as Application Cancellation. For example, if a timeout period is defined as 5 days, when there is no approve/ reject decision for a revert request in Revert Queue, the system approves the request and the application status changes from 'Rejected' to '**Awaiting Credit Approval**' (Credit Queue L1).
- After an approved revert, the **Credit user reworks the case in Credit Queue** — editing the application details and uploading additional supporting documents where required — **without triggering a new AECB enquiry, FTS request or Rule Engine / Limit Assignment re-run**: the previously captured application data remains unchanged. The same application may be reverted more than once, and every revert cycle is maintained in the audit trail (sections 4.6 and 4.7).

Applicable products: **CC, PL**. (CASA is excluded — it has no credit decisioning; Mortgage Loan and Auto Loan are not yet part of the platform scope.)

Scope rule: only rejections with a **Credit root cause** are revertible — **rejected by Credit** in Credit Queue, or **auto-rejected by the System for credit reasons**. The **in-scope rejection cases** are exactly the following five:

- **R1** — Rejected by **Credit user** in Credit Queue (L1–L3).

- **R2** — Auto-rejected by System: **Existing DBR > 50%** after calculation (*parked into Credit Queue L1 under this change; a subsequent Credit rejection is then revertible as R1*).
- **R3** — Auto-rejected by System: **Gross DBR > 100%** (*same parking treatment as R2*).
- **R4** — Auto-rejected by System: application **fails all segmentations** (rejection logic unchanged).
- **R5** — Auto-rejected by System: **approved limit below Min Boundary**, no deviation (rejection logic unchanged).

Not revertible: rejections by Compliance Queue, Risk Queue or Sale Queue (no Credit root cause), and pre-decision terminations (pre-dedupe, no applicable product, AML, geo-fencing, EID-scan, EFR liveness) — see the restriction table below.

Product Type	Applicable Status that can be reverted in Super Portal
CC	Rejected — where the rejection trigger point is revertible (see table below and section 5)
PL	Rejected — where the rejection trigger point is revertible (see table below and section 5)

The revert applies to the below rejection trigger points:

#	Rejection trigger point	Revert outcome
1	Rejected by Credit user in Credit Queue (L1–L3)	Back to 'Awaiting Credit Approval' — Credit Queue L1
2	Auto-rejected by System — Existing DBR > 50% after calculation	System change: the case is parked into Credit Queue L1 ('Awaiting Credit Approval') instead of auto-rejecting — same Failed Reason message as today, with Rule Engine and Limit Assignment results available in the queue view. A subsequent Credit rejection then reverts under row 1 (see section 5)
3	Auto-rejected by System — Gross DBR > 100% safety net	Same treatment as row 2 — parked into Credit Queue L1 instead of auto-rejecting, with the same Failed Reason message and completed Rule Engine / Limit Assignment results
4	Auto-rejected by System — application fails all segmentations (rejection logic unchanged)	Back to 'Awaiting Credit Approval' — Credit Queue L1
5	Auto-rejected by System — approved limit below Min Boundary, no deviation (rejection logic unchanged)	Back to 'Awaiting Credit Approval' — Credit Queue L1

The revert shall be restricted in below scenarios:

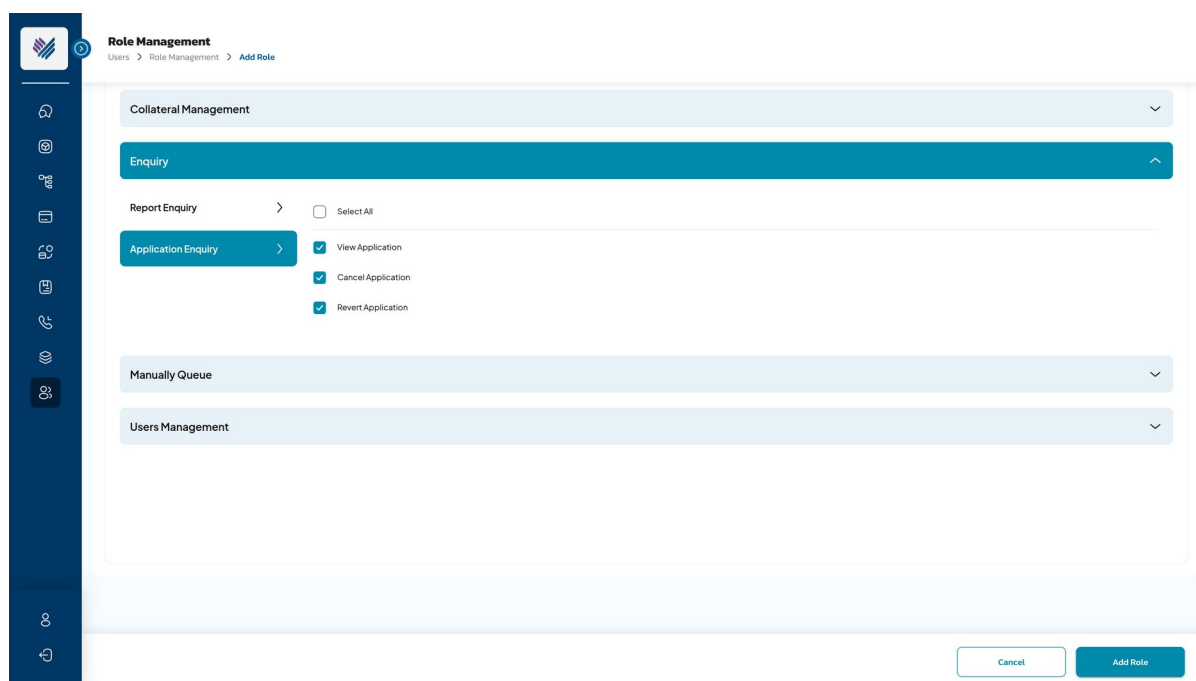

Scenario	Condition / Application Status
Bank users already initiated revert	Revert_App = TRUE (a revert request is already pending in the Revert Queue)
Rejection has no Credit root cause	Rejected by Compliance Queue, Risk Queue or Sale Queue — only Credit-root-cause rejections are revertible (rejected by Credit, or auto-rejected by the System for credit reasons)
Application is not rejected	Any Application Status other than 'Rejected' — Lead In Progress Awaiting Compliance Review Awaiting Risk Review Awaiting Sales Response Awaiting Credit Approval Approval In Principle Awaiting Cooling Off Period Awaiting Signature KFS Signature User Initiated Cancellation Completed
Application already terminated for another reason	Invalidate Insufficient Data Declined Cancelled Failed by Minimum Income Expired Blocked Failed By EFR
Rejection trigger point is not revertible	Pre-dedupe check failure (Step 7.1) No applicable product found ({Pre-Fetch Applicable Product}) AML blacklisted or AML callback decision = rejected geo-fencing, EID-scan or EFR liveness terminations. These failures occur before any queue takes ownership of the case, so there is no previous queue status to return the application to.

END-TO-END APPLICATION REVERT FLOW FROM SUPER PORTAL

1. Role Management: Revert Application Permission

- Bank users must only be able to request a revert if they have been explicitly granted the 'Revert Application' permission within their Super Portal role.
- A new role permission named '**Revert Application**' shall be added under the **Enquiry** module, **Application Enquiry** sub-module in the Role Management section of the Super Portal.

SC1: Add Role screen: Enquiry > Application Enquiry > “Revert Application” permission

Component	Type	Editable	Mandatory	Description
Revert Application Checkbox	Checkbox	Yes	N/A	Selectable checkbox to grant or revoke the 'Revert Application' permission. It indicates whether the role holder can request application reverts for the applicable products (CC and PL).
Revert Application Label	Label	N/A	N/A	Descriptive label shown alongside the checkbox, identifying the permission name.

- Permission behaviour:

Permission Value	Allowed Actions
Revert Application = TRUE	Users can view the 'Revert' button on the Application Enquiry details screen for the applicable products and submit revert requests for Checker approval.
Revert Application = FALSE	Users cannot view the 'Revert' button. Users cannot request application reverts.

'Revert Application' is a distinct right from 'Cancel Application' and from the Revert Queue 'Evaluate Application' permission, so requesting and approving can be granted to different populations. Maker–checker segregation follows the same model as Application Cancellation.

2. Application Revert from Application Enquiry view

- The existing Application Enquiry module in the Super Portal is the entry point for the revert process. Bank users with the 'Revert Application' permission above can initiate a revert request from the Application Details screen.
- The **'Revert'** button is placed in the action bar next to the existing 'Cancel Application' button, and is enabled only when Application Status = 'Rejected', the rejection trigger point is revertible (section 5), and no revert request is already pending.
- Status shown in Application Enquiry after reverting:** while the revert request is pending, the Application Details view continues to show Application Status = **'Rejected'** (Revert_App = TRUE; the Revert button is disabled because a request is pending). Once the revert is **approved** — by the Checker or by the System on timeout — Application Enquiry displays **'Awaiting Credit Approval'**, the application history shows the revert audit steps (section 3 and 4.3), and the Revert button is no longer available since the status is no longer 'Rejected'. If the revert is **rejected**, the view stays 'Rejected' and the Revert button is enabled again for a fresh request.

	Screen
SC2 – Application Enquiry – “Revert” button for the revert request	
SC3 – Revert Confirmation Popup	

Component	Type	Mandatory	Editable	Description
Revert Button	Button	N/A	N/A	Visible only to users with the ' Revert Application ' role. Enabled only for a revertible rejected application with no request already pending. It initiates the revert request for the selected application.
Revert Confirmation Popup (SC3)	Modal Popup	N/A	N/A	Presented when the Revert button is clicked. Requires the user to confirm and provide a Revert Reason before proceeding.
Confirmation Message	Static Text	N/A	N/A	'Are you sure you want to revert the Application? The request will be sent to the Revert Queue for Checker approval.'
Revert Reason	Text input	Yes	Yes	Free-text mandatory field labelled 'Revert Reason *'. Help text: 'Enter your comment'. Users must enter a reason before confirming; the reason is shown to the Checker.
Yes, Revert Button	Button	N/A	N/A	Confirms the request. This sends the application to the Revert Queue for approval.
Back Button	Button	N/A	N/A	Dismisses the popup. Returns user to Application Details screen. No change to the application.

3. Impact of revert submission

When the user clicks 'Yes, Revert' to proceed with the revert submission:

- The Revert Reason is saved as a Comment against the Application details with details as “**REVERT REASON: <reason inputted by user>**” (comment title <<User's name>> <<Department name>>, footer <<Posted Date time>> hh:mm AM/PM | DD MM YYYY).
- **Revert_App = TRUE** is set on the application (a new flag mirroring the existing Cancel_App flag). **Application Status remains “Rejected”** — no new application status is introduced, so the mobile application is unaffected and the customer sees no change while the request is pending.
- The **target queue and status** are resolved per section 5 at submission time and stored on the request — in this scope always '**Awaiting Credit Approval**' — **Credit Queue Level 1**.
- Audit trail is captured with: Step = '**Manually initiate revert**', State = '**User Initiated Revert**', Step Status = 'Successful', Step Details = '**Revert requested by %Username% to Credit Queue. Revert reason is <REVERT_REASON captured above>**', Action by = <user email id>.
- The application is automatically dropped into the **Revert Queue** for further review and approval upon submission of the revert request.

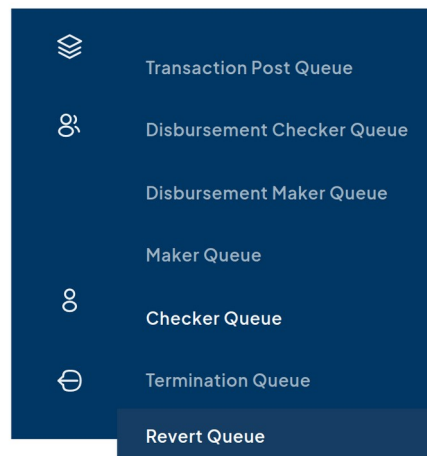

4. Revert Queue

The Revert Queue is a new queue within the Super Portal that allows users to review and make decisions on applications that have been submitted for revert. It provides governance and an approval layer before a rejection is reopened.

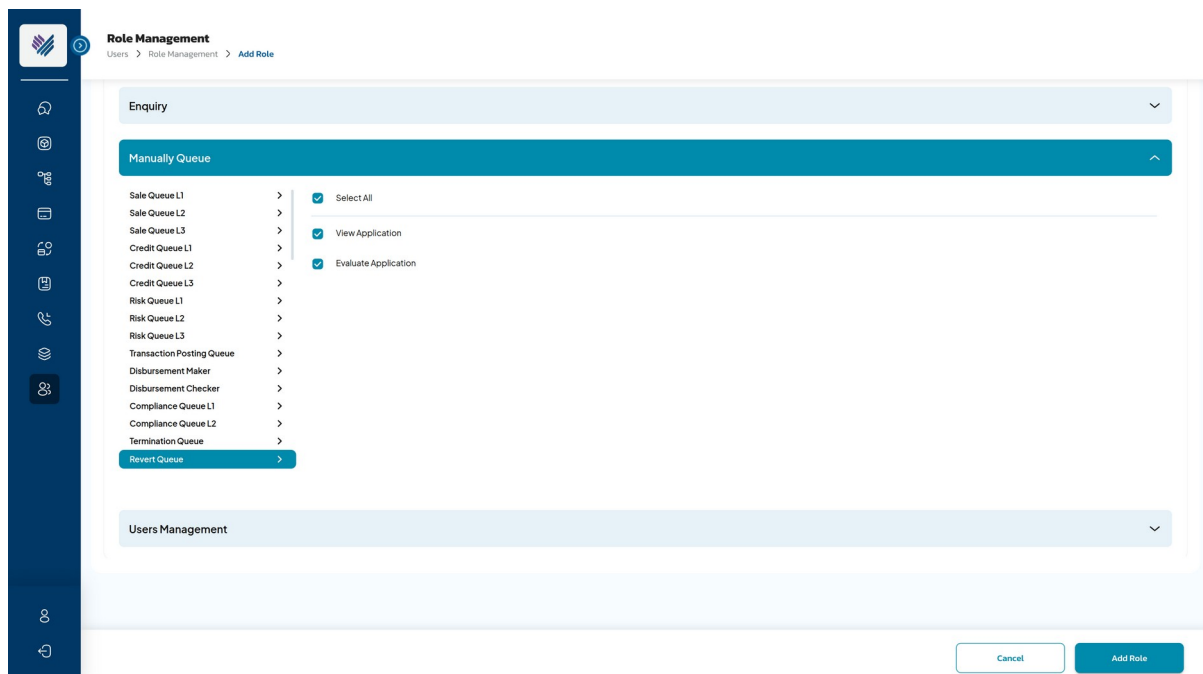

4.1. Revert Queue Menu

'Revert Queue' shall appear as an entry in the Queue menu of the Super Portal, alongside existing queues (e.g. Transaction Post Queue, Checker Queue, Termination Queue, etc.).

SC4: Revert Queue

4.2. Role Information for Revert Queue

SC5: Role permission for Revert Queue

A new queue entry, 'Revert Queue', shall be added under the Manually Queue section in Role Management (Add Role screen). **Two role permissions — View Application and Evaluate Application — apply to the Revert Queue.**

Permission	Value	Access Granted
View Application (Revert Queue)	TRUE	Users can access Revert Queue list view AND view Application Details for all applicable products.
	FALSE	Users cannot see the Revert Queue in the Queue menu.
Evaluate Application (Revert Queue)	TRUE	Users can see and click the Approve / Reject buttons in Revert Queue Application Details.
	FALSE	Users cannot see the Approve or Reject buttons.

4.3. Approve Revert

Application Details
Queue > Revert Queue > Application Details

Details

Application ID : APP_RB_10092600001281 Application Source : APP Product Type : CREDIT CARD

Relationship Status : NTB Application Status : REJECTED Proposed Limit Assignment : B 100,000

Affordability Assessment Result : Unaffordable

Cross-Application Identifier Match ^

Comments **Documents**

Feras Matar Credit
REVERT REASON: Salary certificate received after decisioning – finalised income was understated and the same obligation was counted twice in the DBR. Requesting revert for re-assessment with the corrected figures.
10:42 AM | 18 09 2026

Reject **Approve**

SC6: Revert Queue — Application Details with Approve / Reject

When the user with Evaluate Application permission as TRUE clicks 'Approve' in Revert Queue:

- System displays confirmation popup: 'Are you sure you want to Approve the application revert?'
- If user clicks 'Cancel': popup closes, no action taken.
- If user clicks 'Yes, Approve': system proceeds with the revert.
 - Application Status changes from "Rejected" to **"Awaiting Credit Approval"** and the application re-enters **Credit Queue at Level 1** (section 5).
Revert_App = FALSE.
 - Application is removed from Revert Queue ([Revert Queue] = 'APPROVED').
Toaster: "Revert of <Application ID> is approved".
 - Audit trail is captured with: Step = 'Revert Queue', State = 'Awaiting Credit Approval', Step Detail = 'Application revert requested by "%Username%" and approved by "%Username%"'. Application returned to Credit Queue L1', Action by = <System>.

- Email notification is sent to the bank user who requested the revert to inform them of the outcome.

Type	Subject	Content	Trigger
Email (Bank)	[Super Portal] - Application % %APPLICATION_ID% D%% revert is approved.	Dear %%USER_NAME%%, Please be informed that your request to revert the application % %APPLICATION_ID%% has been approved. The application status has changed from 'Rejected' to 'Awaiting Credit Approval' and the application has been returned to Credit Queue. Best Regards, Reem Bank	One time – send immediately when the revert is approved in Revert Queue, or auto-approved by System on timeout

4.4. Reject Revert

When the user with Evaluate Application permission as TRUE clicks 'Reject' in Revert Queue:

- System displays confirmation popup: 'Are you sure you want to Reject the application revert?'
- If user clicks 'Cancel': popup closes, no action taken.
- If user clicks 'Yes, Reject': the revert request is rejected and the application is unchanged.
 - Application Status remains “**Rejected**”; Revert_App = FALSE (a fresh request may be raised later if new information emerges).
 - Application is removed from Revert Queue ([Revert Queue] = 'REJECTED'). Toaster: “Revert of <Application ID> is rejected”.
 - Audit trail is captured with: Step = 'Revert Queue', State = 'Rejected', Step Detail = 'Application revert requested by “%Username%” and rejected by “%Username%”, Action by = <System>.
 - Email notification is sent to the bank user who requested the revert to inform them of the outcome.

Type	Subject	Content	Trigger
Email (Bank)	[Super Portal] - Application % %APPLICATION_ID% D%% revert is not approved.	Dear %%USER_NAME%%, Please be informed that your request to revert the application % %APPLICATION_ID%% is rejected. The application remains Rejected. Best Regards, Reem Bank	One time – send immediately when the revert request is rejected by Checker in Revert Queue

4.5 Timeout scenario if no decision taken in the Revert Queue within a pre-defined period

A configurable timeout period of [X] days begins when the revert request is submitted (proposed default: 5 days, configurable in database — matching the cancellation timeout). The following outcomes apply:

Scenario	Outcome
Request is APPROVED in Revert Queue within [X] days	Application status changes from 'Rejected' to 'Awaiting Credit Approval' and the application re-enters Credit Queue at Level 1. Please refer to 4.3 above.
Request is REJECTED in Revert Queue within [X] days	Application remains "Rejected". Please refer to 4.4 above.
No decision taken within [X] days	The request is auto-approved by the System the next day after the timeout period ends — the same behaviour as the Application Cancellation timeout. Application status changes from 'Rejected' to ' Awaiting Credit Approval ', the application re-enters Credit Queue at Level 1 , Revert_App = FALSE, and it is removed from the Revert Queue. Audit trail is captured with: Step = 'Auto Revert Approval on timeout', State = 'Awaiting Credit Approval', Step Detail = 'Application revert requested by "%Username%" and approved by System, as per approval timeout configuration of [X] days. Application returned to Credit Queue L1', Action by = <System>. Email notification is sent to the bank user who requested the revert — same email as in 4.3.

4.6 Credit rework after an approved revert

Once the revert is approved and the application has returned to 'Awaiting Credit Approval' — Credit Queue Level 1, the Credit user works the case under the existing Credit Queue capability:

- **Edit / rework the application details:** the Credit user can edit and rework the application details (credit parameters) after the revert, as per the current Credit Queue behaviour, before re-decisioning the case.
- **Upload additional supporting documents:** the Credit user can upload additional supporting documents against the application after the revert (Documents section of the application details). Uploaded documents follow the existing document type, size and audit rules and are visible to all subsequent reviewers of the case.
- **No external or system re-triggers:** reverting a case does **not** trigger a new AECB enquiry, a new FTS request, or a **Rule Engine / Limit Assignment re-run**. The previously captured application data and results remain **unchanged** when the application is reverted back to Credit Queue — the Credit user reworks the case on the data as it stands.

4.7 Multiple reverts

- The same application **can be reverted more than once** — no cap applies to the number of reverts per application in this version.
- **Each revert is maintained in the audit trail:** every revert cycle writes its own complete audit set — initiation ('Manually initiate revert'), the Checker decision ('Revert Queue') or the timeout ('Auto Revert Approval on timeout'), and the outcome. The original rejection record is never modified, so the full history of every revert remains visible in the application history in chronological order.

4.8 Exception handling and duplicate prevention

- **Duplicate and concurrent actions prevented:** a single pending revert request per application is enforced (Revert_App flag — the Revert button is disabled while a request is pending), and a request that has already been decided cannot be decided again. The detailed retry / rollback design is elaborated in the technical design document for this feature.

5. Revert target status determination

The revertibility of an application is determined by **how it became Rejected** — the system derives the rejection root cause from the audit step recorded at the point of rejection, and resolves it when the request is raised. Only **Credit-root-cause** rejections are revertible, so in this scope the target is always **'Awaiting Credit Approval' — Credit Queue Level 1**; the case then escalates through levels under the standard queue rules. No new data capture is required:

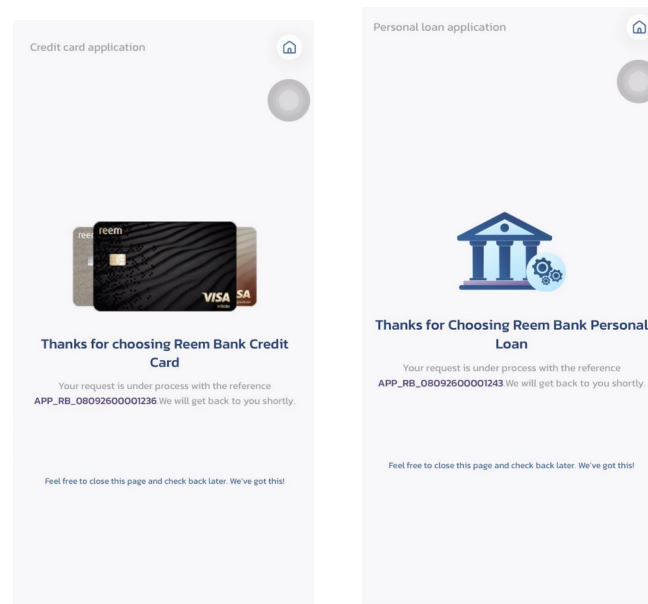

Audit step recorded at rejection	Rejection origin	Revert	Target status (queue, level)
{Rejected in Credit Queue [Level]}	Credit user rejects in Credit Queue L1–L3	Yes	Awaiting Credit Approval — Credit Queue L1
{Safety net for Finance DBR}	System — Existing DBR > 50% after calculation	Via parking change below	Awaiting Credit Approval — Credit Queue L1
{Safety net for Gross DBR}	System — Gross DBR > 100%	Via parking change below	Awaiting Credit Approval — Credit Queue L1
{Fail Strategies Check}	System — fails all segmentations (logic unchanged)	Yes	Awaiting Credit Approval — Credit Queue L1
Approval Limit Result = "Failed"	System — approved limit < Min Boundary, no deviation (logic unchanged)	Yes	Awaiting Credit Approval — Credit Queue L1
Compliance Reject	Compliance user rejects in Compliance Queue L1–L2	No — out of scope	— (no Credit root cause)
Risk Reject	Risk user rejects in Risk Queue L1–L3	No — out of scope	— (no Credit root cause)
Sale Reject	Sales user rejects in Sale Queue	No — out of scope	—
{Pre-Fetch Applicable Product} / pre-dedupe steps / AML	System terminations before any queue ownership	No	—

System change — DBR parking. Today, a breach of the DBR safety nets — **Existing DBR > 50%** after calculation, or **Gross DBR > 100%** — auto-rejects the application with Action by = <system>, leaving no previous queue status to restore. The system shall instead **park the case into Credit Queue L1** ('Awaiting Credit Approval') for both safety nets: the **Failed Reason continues to show the same message** as the current auto-rejection, and the system shall **complete the Rule Engine run and Limit Assignment** so the RE result and limit-assignment result are available in the Credit Queue view — the Credit user must have enough information to decide. If the Credit user then rejects the case, that rejection carries a named owner and is revertible under the standard rule (row 1). This parking applies to every safety-net breach, not only cases later reverted — Credit Queue volume impact should be sized during estimation.

No change to the other auto-rejections. The “fails all segmentations” and “approved limit < Min Boundary” cases keep their current auto-rejection logic — no parking is introduced for them. A revert of such a case returns it to ‘Awaiting Credit Approval’ — Credit Queue L1, where a Credit user takes ownership of the re-decision.

6. Customer returns to Customer Journey after revert

- **While the request is pending:** nothing changes for the customer — the application is still Rejected and the 30-day pre-dedupe re-application block continues to apply.
- **After an approved revert — resume back to the “under process” screen:** the application is in-flight again in Credit Queue, so the pre-dedupe *in-progress application* check blocks a new same-product application (correct and unchanged). A customer who resumes the journey in the app lands on the standard **application under process** holding screen — “Thanks for choosing Reem Bank <Product> — Your request is under process with the reference <Application ID>” (SC7 / SC8 below) — not on the rejection screen and not into a new application flow. Regression required on this resume behaviour.

SC7 / SC8: Customer resume after an approved revert — application under process (CC / PL)

- **If the application is rejected again after a revert:** the 30-day re-application window **restarts from the latest rejection** — the countdown begins again at the new rejection date.

- **Disclosures on the reopened journey:** after an approved re-assessment, the application proceeds through the **standard offer and acceptance journey** — AIP, cooling-off and KFS/DDA signature stages are generated afresh by the existing flow, so every disclosure the customer receives reflects the final approved terms (no change to existing KFS behaviour).
- **Customer communication — final confirmation only, exactly one email (Credit User note):** the customer already received the rejection notification at the point of decision and is **not** notified of the reopen. When the re-assessment completes, the system sends the client **exactly one email**, whether the outcome is Approve or Reject — and **both templates mention the further review (re-assessment)**: on approval, the first Email (Client) template below; on a **repeat rejection, the client is also emailed**, using the second template below (not the generic first-rejection notification), and the 30-day window restarts. The reopened run must **not** double-send decision notifications to the client (the original rejection email has already gone out once).

Type	Subject	Content	Trigger
Email (Client)	Reem Bank — Update on your application %APPLICATION_ID%	Dear %%CUSTOMER_NAME%%, After re-assessment, your %PRODUCT_TYPE% application %%APPLICATION_ID%% has been approved. We will be in touch with the next steps. Best Regards, Reem Bank	One time — approved after re-assessment (application reopened via approved revert). Newly added in Communication Setup.
Email (Client)	Reem Bank — Update on your application %APPLICATION_ID%	Dear %%CUSTOMER_NAME%%, After re-assessment, your %PRODUCT_TYPE% application %%APPLICATION_ID%% has not been approved. You may submit a new application after 30 days. Best Regards, Reem Bank	One time — rejected again after re-assessment (replaces the generic rejection notification). Exactly one client email per decision — either way.

7. Summary

Step	Actor	Action	Application Status	Next Step
1	Bank User (Maker)	Clicks 'Revert' on Application Details screen of a rejected application, enters Revert Reason and confirms	Rejected (Revert_App = TRUE)	Application routed to Revert Queue
2	System	Application dropped into Revert Queue; target queue/status resolved and stored	Rejected (Revert_App = TRUE)	Await Checker decision

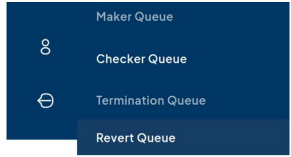

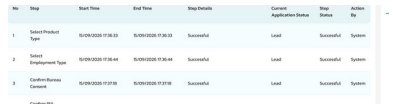

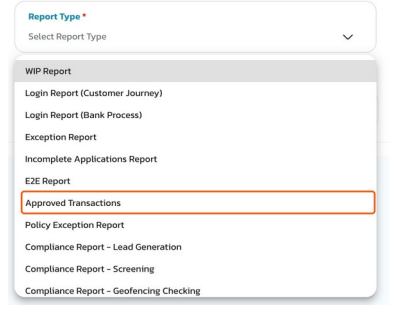

Step	Actor	Action	Application Status	Next Step
3a	Checker (Revert Queue)	Clicks 'Approve' and confirms	Awaiting Credit Approval	Application re-enters Credit Queue at Level 1; email notification sent to Maker; application removed from queue
3b	Checker (Revert Queue)	Clicks 'Reject' and confirms	Rejected	Email notification sent to Maker; application removed from queue; Revert_App = FALSE
3c	System (auto-timeout)	No checker action within [X] days — request auto-approved (same as cancellation timeout)	Awaiting Credit Approval	Application re-enters Credit Queue at Level 1; email notification sent to Maker; Revert_App = FALSE
4	Queue User (Credit)	Works the case as normal — edits/reworks the application details and uploads additional supporting documents where required (section 4.6) , then approves, overrides or rejects — no AECB enquiry, FTS request or Rule Engine / Limit Assignment re-run is triggered by the revert; the previously captured data remains unchanged	Awaiting Credit Approval	Application re-decided against the currently published credit policy; the client receives exactly one re-assessment email either way — approval or rejection (section 6); on rejection the 30-day window restarts

ADDITIONAL IMPACT ANALYSIS

Beyond the direct scope above, the following areas of the Reem Bank platform are impacted and must be carried into estimation and test scope:

Area	Impact	Screen
Role Management / Permission Matrix	Three new permission entries — 'Revert Application' (Enquiry > Application Enquiry), plus 'View Application' and 'Evaluate Application' on the Revert Queue (Manually Queue). All three are product-agnostic: a single permission each across CC and PL, matching the existing permission layout. Each is a distinct right — bundling permissions that cover different actions has previously required production hotfixes. The Permission Matrix reference page must be updated.	 Role Management > Application Enquiry (SC1)
Queue model / drop points	One new queue (Revert Queue) in the Queue menu and the Manually Queue role section. The drop-points matrix gains a new entry (approved revert → Credit Queue L1), plus the parking of both DBR safety nets (Existing DBR > 50% and Gross DBR > 100%) → Credit Queue L1, which increases Credit Queue volume for every breach — not only reverted cases. Parked cases must carry the completed Rule Engine and Limit Assignment results into the queue view. The new parking drop points must be aligned with the drop-point / Failed Reason updates currently in delivery, and the DBR thresholds with the in-flight two-DBR calculation change.	 Queue menu — Revert Queue (SC4)
Status model / mobile app	No new Application Status is introduced (Revert_App flag only, mirroring Cancel_App), so the mobile application requires no change and never displays a state that misrepresents the case.	 Revert_App flag while pending — no new Application Status, no mobile-app change Status transition on approved revert

Area	Impact	Screen
Audit trail	Three new audit steps — 'Manually initiate revert', 'Revert Queue', 'Auto Revert Approval on timeout' — each writing the full standard field set. The original rejection record is never modified. Revertibility is derived from the audit step recorded at rejection, so the known defect in the audit trail written for Financial-DBR rejections must be resolved before this feature relies on it. Each revert cycle writes its own complete audit set, so repeated reverts remain fully traceable end-to-end (section 4.7).	 Application history steps — Application Enquiry
Communication Setup	Four templates newly added in Communication Setup: two Email (Bank) templates per product (revert approved / not approved) and two Email (Client) templates — approval after re-assessment and rejection after re-assessment, both mentioning the further review (section 6). English, banking tone, signing off as Reem Bank. Exactly one client email per re-assessment decision — Approve or Reject — with duplicate decision notifications suppressed on the reopened run. The Compliance / Risk reject confirmation texts stay as they are — those rejections remain non-revertible.	 Communication Setup > Email Templates — Type: Client / Bank
Reporting / MIS (Report Enquiry)	Within this scope, the existing Approved Transactions report gains the revert fields: Revert Reason, Repeated Reverts (number of revert cycles) and Updated (latest) Rejection Reason.	 Report Enquiry > Report Type — Approved Transactions
