Application Revert in Super Portal

V1.1

This is not a legally binding document.

Highly confidential not to be shared without written consent.

APPLICATION REVERT IN SUPER PORTAL

FEATURE OVERVIEW

This document describes the Super Portal **Application Revert** capability, which allows authorised bank staff to return a **rejected** application to the queue status it held immediately before the rejection decision was taken, so that the case can be re-assessed without the customer having to reapply. It complements the existing **Cancel Application** capability: where Cancel terminates an application, Revert reopens one.

Revert follows the **same maker-checker governance already in place for Application Cancellation**. The bank user who requests the revert is the **Maker**. The request is not applied immediately: the application is held in an intermediate status and placed in a **Revert Queue**, where a second user — the **Checker** — approves or rejects it. The application is returned to its previous queue status only once the Checker approves. Key steps are as following:

- **Maker** — bank user with the '**Revert Application**' permission opens a rejected application in **Application Enquiry** and clicks '**Revert**'.
- The Maker confirms and enters a mandatory **Revert Reason** for approval from the Checker.
- Application Status is updated to '**User Initiated Revert**' and the application is dropped into the **Revert Queue**. It is **not** yet returned to its previous status.
- **Checker** — user with the '**Evaluate Application**' permission on the Revert Queue reviews the request and the Revert Reason, then approves or rejects it.
- On **approval**, the application is returned to the queue status held immediately before the rejection and re-enters that queue. On **rejection**, the application remains **Rejected**.
- If no decision is made within a configurable timeout period, the revert request **lapses** and the application remains **Rejected**.

The primary business driver is to support the **Credit Department**. Today, once an application is rejected — whether by a queue user or automatically by the system on credit grounds — there is no route back and the customer must reapply. In practice Credit frequently needs to revisit a rejection because a credit parameter was wrong, incomplete or has since changed; for example, income evidence arrives late, an obligation was double-counted, or a decision boundary is re-tuned. Revert gives Credit a controlled, dual-controlled way to bring the case back into the queue, update the credit parameters and re-decision it.

Applicable products: CC, PL, CASA.

Product Type	Applicable Status that can be reverted in Super Portal
CC	Rejected
PL	Rejected
CASA	Rejected

Revert operates on a single application status. In every status other than **Rejected** the button is displayed in a disabled state, consistent with the existing treatment of the Cancel Application button.

TBC Confirm whether **Mortgage Loan** is in scope. The Mortgage journey terminates to *Cancelled* rather than *Rejected* on failure, so it would not be captured by the rule as drafted.

The revert shall be restricted in below scenarios:

Scenario	Condition / Application Status
Bank users already initiated revert	Application Status = 'User Initiated Revert' — a request is already awaiting a Checker decision in the Revert Queue and a second request cannot be raised.
Application is not in a rejected state	Any Application Status other than Rejected — including Lead, In Progress, Awaiting Compliance Review, Awaiting Risk Review, Awaiting Sales Response, Awaiting Credit Approval, Approval In Principle, Awaiting Cooling Off Period, Awaiting Signature, KFS Signature and Completed.
Application already terminated for another reason	Cancelled User Initiated Cancellation Expired Blocked Invalidate Insufficient Data Insufficient Time Declined Failed by EFR Failed by Minimum Income Failed by IBAN
Application failed at Pre-Dedupe Check stage	The failure occurs at the very beginning of the journey, before any queue is involved. There is no queue that handles applications at this stage, so there is no previous status to return the application to.
No applicable product found	The application could not be matched to a product — audit step <i>{Pre-Fetch Applicable Product}</i> , step detail <i>"There is no applicable product for Application"</i> . With no product resolved, the system has no decisioning path to return the application to.
Rejected by the AML system	AML outcomes are handled through the manual override results of the AML screening process rather than a queue rejection. These cases must continue to follow the AML override route.

Where a rejected application falls into one of the restricted scenarios above, the Revert button remains visible but disabled, so that the user can see the action exists and is simply not available for that case.

TBC **'User Initiated Revert'** is a new application status. Confirm that it is added to the **Cancellation** restriction list, so that an application awaiting a revert decision cannot also be submitted for cancellation at the same time.

END-TO-END APPLICATION REVERT FLOW FROM SUPER PORTAL

1. Role Management: Revert Application Permission (Maker)

- Bank users must only be able to request a revert if they have been explicitly granted the '**Revert Application**' permission within their Super Portal role.
- A new role permission named '**Revert Application**' shall be added under the **Enquiry** module, **Application Enquiry** sub-module in the Role Management section of the Super Portal, alongside the existing '**Cancel Application**' permission.

SC1: Add Role screen — Enquiry > Application Enquiry > 'Revert Application' permission

Component	Type	Editable	Mandatory	Description
Revert Application Checkbox	Checkbox	Yes	N/A	Selectable checkbox to grant or revoke the 'Revert Application' permission for a role. It indicates whether the role holder can request application reverts.
Revert Application Label	Label	N/A	N/A	Descriptive label shown alongside the checkbox, identifying the permission name.

Permission behaviour:

Permission Value	Allowed Actions
Revert Application = TRUE	Users can view the 'Revert' button on the Application Enquiry details screen and submit revert requests for Checker approval.
Revert Application = FALSE	Users cannot view the 'Revert' button. Users cannot request application reverts.

TBC Confirm whether 'Revert Application' should be restricted to Credit Department roles only, or made available to any role at the bank's discretion. The stated business driver is Credit-led,

but a Compliance or Risk rejection returns the application to those teams rather than to Credit.

2. Application Revert from Application Enquiry view (Maker)

- The existing **Application Enquiry** module in the Super Portal is the entry point for the revert process. Bank users with the 'Revert Application' permission can request a revert from the **Application Details** screen.
- The '**Revert**' button is placed in the same action bar as the existing '**Cancel Application**' button, at the foot of the Application Details panel.
- The button is **enabled only when Application Status = 'Rejected'** and the rejection origin is revertible. In all other cases it is displayed disabled.

The screenshot displays the 'Application Enquiry' interface. At the top, there's a header with application details: Offer ID: PersonalLoan0001, Relationship Status: ETB, Email ID: Khaled.Mohammed@appro.ae, Full Name: Rohail Abbas Syed Mumtaz Abbas Zaidi, Proposed Calculated Limit: 342,110.23, and Offer Name: PersonalLoan0001.

The main section contains a table with 10 steps, all marked as 'Successful'. The steps include Select Product Type, Select Employment Type, Confirm Bureau Consent, Confirm PIA statement, Confirm FTS statement, Confirm Marketing Consent, Confirm T&C, Confirm Cooling Off Period, Scan EID (Front & Back), and Pre-dedupe Check.

On the right, there's a sidebar with 'Application Details', 'View Documents', and 'Comments'. The 'Application Details' section is expanded, showing various indicators like Cross-Application Identifier Match, Approved Credit Information, Failed Reasons, Customer Due Diligence, Application Details, Income Related Info, Liability Info, Credit Indicator, and DBR Indicator.

At the bottom right, there's an action bar with two buttons: 'Cancel Application' and 'Revert'. The 'Revert' button is highlighted with a red dashed border and a 'NEW' badge, indicating it's the focus of the document.

SC2: Application Enquiry — 'Revert' button placed next to the existing 'Cancel Application' button

SC3: Revert Confirmation Popup — the Revert Reason is entered for approval from the Checker

Component	Type	Mandatory	Editable	Description
Revert Button	Button	N/A	N/A	Visible only to users with the 'Revert Application' permission. Enabled only when Application Status = 'Rejected' and the rejection origin is revertible. It initiates the revert request for the selected application.
Revert Confirmation Popup (SC3)	Modal Popup	N/A	N/A	Presented when the Revert button is clicked. Requires the user to confirm and provide a Revert Reason before the request is submitted to the Checker.
Confirmation Message	Static Text	N/A	N/A	'Are you sure you want to revert this Application?' with the supporting line 'The request will be sent to the Revert Queue for Checker approval. If approved, the application will be returned to <TARGET_STATUS>.'
Target Status Display	Static Text	N/A	N/A	Displays the status the application will be returned to on approval, derived per section 5, so both Maker and Checker can see the outcome before it is applied.
Revert Reason	Text input	Yes	Yes	Free-text mandatory field labelled 'Revert Reason *'. Help text: 'Enter your comment'. Users must enter a reason before confirming. The reason is shown to the Checker.
Yes, Revert Button	Button	N/A	N/A	Confirms the request. Sends the application to the Revert Queue for Checker approval.

Confidential

This is not a legally binding document · Highly confidential not to be shared without written consent

Component	Type	Mandatory	Editable	Description
Back Button	Button	N/A	N/A	Dismisses the popup. Returns user to the Application Details screen. No change to the application.

3. Impact of revert submission

When the Maker clicks 'Yes, Revert' to submit the revert request:

3.1 Save Revert Reason as Comment

The Revert Reason text is displayed in the Comment area with the below details:

- Comment title: <<User's name posted comment>> <<Department name>>
- Comment body: **"REVERT REASON: <Content of Revert Reason inputted>"**
- Comment footer: <<Posted Date time>> (format hh:mm AM/PM | DD MM YYYY)
- Save comment to DB with prefix **"REVERT REASON"** — format: REVERT REASON: <revert reason comment text>

3.2 Application status and audit trail

- Application Status = **'User Initiated Revert'** — the application is **not** yet returned to its previous status
- The application is dropped into the **Revert Queue** for Checker review (section 4)
- The **target status** is determined at submission (section 5) and displayed to both the Maker and the Checker

The below [Application History] object logs shall be stored as audit trail information and displayed as the Application step details under the Application Enquiry details screen:

Field	Value
[Application ID]	<current Application ID>
[Step]	"Manual revert process"
[State]	"User Initiated Revert"
[Start Time] / [End Time]	Recorded by appro with following format: yyyy-MM-dd HH:mm:ss
[Step Status]	"Success"
[Step Detail]	"Manual revert initiated by %Username%. Revert reason is <REVERT_REASON SC3>"
[Action by]	<user email id>

The **original rejection record is retained** in the audit trail and in the Application Failed Reasons section. Revert does not erase the prior decision — it adds new events on top of it, so the full decision history remains auditable.

4. Revert Queue (Checker)

The Revert Queue is a new queue within the Super Portal that allows the Checker team to view and make decisions on applications that have been submitted for manual revert. It provides the governance and approval layer before a rejection is reopened, mirroring the Termination Queue used for manual cancellation.

4.1 Revert Queue Menu and List View

- 'Revert Queue' shall appear as an entry in the **Queue** menu of the Super Portal, alongside the existing queues such as the Termination Queue.
- Navigation: user clicks **Queue** in the left menu, then the **Revert Queue** sub-menu. The Revert Queue list screen is displayed. Clicking a row opens the Application Details screen.
- For viewing and searching the list of applications, the queue follows the same behaviour as the existing Super Portal manual queues. No new list behaviour is introduced.

TBC Confirm whether a **separate Revert Queue** is required, or whether revert requests should be evaluated in the existing **Termination Queue**. A separate queue is recommended: the two request types have opposite outcomes, different checker populations may be appropriate, and mixing them in one list makes the checker decision ambiguous.

4.2 Role Information for Revert Queue

Under **Manually Queue**, a new queue shall be introduced as **“Revert Queue”** with View and Evaluate application roles.

The screenshot shows the 'Add Role' interface. On the left is a sidebar with navigation icons. The main area has a form for adding a role. The 'Role Name' field contains 'Credit Checker'. The 'Description' field contains 'Checker team — evaluates revert and cancellation requests'. Under the 'Permissions' section, there are two expandable menus: 'Termination Queue' (existing) and 'Revert Queue' (Manually Queue > Revert Queue). Both menus have 'View Application' and 'Evaluate Application' permissions checked. The 'Revert Queue' section is highlighted with a red dashed border. At the bottom right are 'Cancel' and 'Save' buttons.

SC4: Add Role screen — Manually Queue > Revert Queue role permissions

Component Name	Component Type	Editable	Mandatory	Description
Revert Queue	Main Label	NA	NA	Revert Queue heading under the Manually Queue in the Add Role screen

Component Name	Component Type	Editable	Mandatory	Description
View Application	Check box	Y	NA	Check box should be provided to indicate the selection of the Role details
Evaluate Application	Check box	Y	NA	Check box should be provided to indicate the selection of the Role details

Update to the Permission Matrix:

Menu (Group Permission)	Sub-Menu (Permission)	Action (Permission Detail)	Status Display in UI	Display Permission Name
Manually Queue	Revert Queue	View List of Applications	Viewer	View Application
		Approve Application	Approver	Evaluate Application
		Reject Application	Approver	Evaluate Application

Apply rules:

Permission Value	Access Granted
View Application (Revert Queue) = TRUE	Users can access the Revert Queue list view AND view Application Details.
View Application (Revert Queue) = FALSE	Users cannot see the Revert Queue in the Queue menu.
Evaluate Application (Revert Queue) = TRUE	Users can see and click the Approve / Reject buttons in the Revert Queue Application Details and perform the action.
Evaluate Application (Revert Queue) = FALSE	Users cannot see the Approve or Reject buttons.

TBC Confirm whether the system must **prevent the Maker from approving their own revert request**. The Cancellation flow does not state this control explicitly. Since the business purpose of the Checker is a genuine second pair of eyes, it is recommended that a user holding both permissions cannot evaluate a request they raised themselves.

4.3 Revert Queue Details View

- The Details section displays the same information as the **Detail Screen Description of Application Enquiry**. No new data points are introduced.
- The collapsible **Sections** list shows the same detail sections displayed under Application Enquiry, collapsed by default.
- The **Comments** tab is **selected by default** when accessing the screen, so that the Revert Reason entered by the Maker is the first thing the Checker sees.
- The **Document** tab is available and behaves as per the existing implementation.

SC5: Revert Queue — Application Details with the Maker's Revert Reason and the Approve / Reject actions

Component	Component Type	Editable	Mandatory	Description
Application Detail	Label	N/A	N/A	Default value is “Application Detail”.
Link navigate	Label	N/A	N/A	Default value is “Queue > Revert Queue > Application Details”.
Details	Section	N/A	N/A	Display same info as the Detail Screen Description of Application Enquiry, plus the requesting user and the target status the application will return to on approval.
Sections	Section	N/A	N/A	Display detail information of the application. User can collapse / expand. Default is Collapsed.
Comment	Tab link	N/A	N/A	Opens the Comment tab. This tab is selected by default when accessing the screen, showing the REVERT REASON comment.
Document	Tab link	N/A	N/A	Opens the Document tab.
Approve Button	Button	N/A	N/A	Visible only to users with 'Evaluate Application' = TRUE. Approves the revert request.
Reject Button	Button	N/A	N/A	Visible only to users with 'Evaluate Application' = TRUE. Rejects the revert request.

4.4 Approve Revert

When the user with Evaluate Application permission as TRUE clicks '**Approve**' in the Revert Queue:

- System displays confirmation popup: '**Are you sure you want to Approve the application revert?**'
- If user clicks '**Cancel**': popup closes, no action taken.
- If user clicks '**Yes, Approve**': system proceeds with the revert.

SC6: Approve and Reject confirmation popups in the Revert Queue

On approval:

- Application Status = **<TARGET_STATUS>** — Awaiting Credit Approval, Awaiting Compliance Review or Awaiting Risk Review, as determined in section 5
- The application re-enters the corresponding queue — Credit Queue, Compliance Queue or Risk Queue — and appears in that queue's list view for action
- Approval toaster message is displayed: **"Revert of <Application ID> is approved"**
- Update [Revert Queue] = '**APPROVED**' → remove application from the Revert Queue. The user cannot search for or access the application from the Revert Queue.
- Email notification is sent to the bank user who requested the revert

Audit trail for checker approval:

Field	Value
[Application ID]	<current Application ID>
[Step]	"Revert Queue"
[State]	<TARGET_STATUS>
[Start Time] / [End Time]	Recorded by appro with following format: yyyy-MM-dd HH:mm:ss
[Step Status]	"Success"
[Step Detail]	Application revert requested by "%Username%" and approved by "%Username%"
[Action by]	<System>

4.5 Reject Revert

When the user with Evaluate Application permission as TRUE clicks '**Reject**' in the Revert Queue:

- System displays confirmation popup: '**Are you sure you want to Reject the application revert?**'
- If user clicks '**Cancel**': popup closes, no action taken.
- If user clicks '**Yes, Reject**': the revert request is rejected and the application status is restored.
- Application Status = "**Rejected**" — the status held before the revert request was raised
- Rejection toaster message is displayed: "**Revert of <Application ID> is rejected**"
- Update [Revert Queue] = '**REJECTED**' → remove application from the Revert Queue.
- Email notification is sent to the bank user who requested the revert

Audit trail for checker rejection:

Field	Value
[Application ID]	<current Application ID>
[Step]	"Revert Queue"
[State]	"Rejected"
[Start Time] / [End Time]	Recorded by appro with following format: yyyy-MM-dd HH:mm:ss
[Step Status]	"Success"
[Step Detail]	Application revert requested by "%Username%" and rejected by "%Username%"
[Action by]	<System>

A rejected revert request does not bar a future request. If new information becomes available, the Maker may raise a fresh revert request on the same application, subject to the restrictions in the Feature Overview.

4.6 Timeout scenario if no decision is taken in the Revert Queue

A configurable timeout period of **[X] days** begins when the revert request is submitted. The following outcomes apply:

Scenario	Outcome
Request is APPROVED in the Revert Queue within [X] days	Application status changed from 'User Initiated Revert' to <TARGET_STATUS> and the application re-enters the owning queue. Please refer to 4.4 above.
Request is REJECTED in the Revert Queue within [X] days	Application status changed from 'User Initiated Revert' back to 'Rejected' . Please refer to 4.5 above.
No decision taken within [X] days	The revert request lapses . The system updates the application status from 'User Initiated Revert' back to 'Rejected' the next day after the timeout period ends, and removes the application from the Revert Queue. Email notification is sent to the bank user who requested the revert — same email as in 4.5.

Audit trail for the timeout outcome:

Field	Value
[Step]	“Auto Revert Rejection on timeout”
[State]	“Rejected”
[Step Status]	“Success”
[Step Detail]	Application revert requested by "%Username%" and rejected by System, as per approval timeout configuration of [X] days
[Action by]	<System>

TBC The timeout default is deliberately the opposite of Cancellation — please confirm. For manual cancellation, an un-actioned request auto-**approves** and the application is cancelled. For Revert the recommended default is to let the request **lapse**, leaving the application Rejected. Auto-approving a revert would reopen a rejected case with no second pair of eyes, which is precisely the control the Checker exists to provide; letting it lapse returns the application to a status it validly held. Confirm this, and confirm the value of **[X]** — 5 days is proposed, to match the cancellation timeout.

4.7 Email notifications

Email notifications are sent to the bank user who requested the revert, following the same pattern as the cancellation flow:

Type	Subject	Content	Trigger
Email	[Super Portal] - Application %APPLICATION_ID%% revert is approved.	Dear %%USER_NAME%%, Please be informed that your request to revert the application %%APPLICATION_ID%% has been approved. The application has been returned to %%TARGET_STATUS%%. Best Regards, Reem Finance	One time — send immediately when the revert is approved in the Revert Queue
Email	[Super Portal] - Application %APPLICATION_ID%% revert is not approved.	Dear %%USER_NAME%%, Please be informed that your request to revert the application %%APPLICATION_ID%% is rejected. The application remains Rejected. Best Regards, Reem Finance	One time — send immediately when the revert is rejected in the Revert Queue, or when the request lapses on timeout

TBC Confirm the email template wording and whether separate templates are required for the checker rejection and the timeout lapse, or whether one template covers both outcomes.

5. Revert target status determination

The status an application is returned **to** on approval is determined by **how it became Rejected**, not by the Maker or the Checker. The system derives the target status from the application's own audit trail — specifically, from the step recorded at the point of rejection — and displays it on the confirmation popup and in the Revert Queue before any decision is taken.

5.1 Rejection by a queue user

Ref	Rejection origin	Application Status after approved Revert	Application re-enters
R1	Rejected by Credit user in Credit Queue	Awaiting Credit Approval	Credit Queue
R2	Rejected by Compliance user in Compliance Queue	Awaiting Compliance Review	Compliance Queue
R3	Rejected by Risk user in Risk Queue	Awaiting Risk Review	Risk Queue

TBC The **Sales Queue** also rejects applications today, but Sales rejections were not covered in the agreed scope. Confirm whether a Sales Queue rejection should be revertible to **Awaiting Sales Response**, or deliberately excluded.

5.2 Auto-rejection by the system on credit grounds

Ref	Rejection origin	Treatment	Status after approved Revert	Re-enters
R4	DBR above threshold	System behaviour changes — the application is routed to Credit Queue instead of being auto-rejected outright, per section 6. The Credit user then rejects it in the queue.	Awaiting Credit Approval	Credit Queue
R5	Failed all segmentations	Auto-rejected by the system as today; flagged as revertible	Awaiting Credit Approval	Credit Queue
R6	Approved Limit amount < Min Boundary	Auto-rejected by the system as today; flagged as revertible	Awaiting Credit Approval	Credit Queue

Rationale for R4. A DBR above the threshold is a credit judgement, not a hard eligibility failure. Routing the case into the Credit Queue first — rather than auto-rejecting it — means the rejection is recorded as a **queue decision** with a named decision-maker, which in turn makes it revertible under the standard R1 rule. This removes the need for a special revert path for DBR cases and keeps a single, auditable decision model. It also follows an established pattern: a **Refer** outcome from limit assignment already routes to the Credit Queue.

Rationale for R5 and R6. Both outcomes are driven by configurable credit parameters — segmentation criteria and decision boundaries. When those parameters are corrected, the same application should be re-assessable. Returning to **Awaiting Credit Approval** places the case in front of the Credit team who own those parameters.

5.3 How the system identifies the rejection origin

Each rejection path already writes a distinct step to the audit trail. The system shall use that step to determine both **whether** the application is revertible and **which** status it returns to. No new data capture is required.

Audit trail step recorded at rejection	Rejection origin	Revert	Target Application Status
{Rejected in Credit Queue}	Credit Queue — manual decision	Yes	Awaiting Credit Approval
Compliance Reject	Compliance Queue — manual decision	Yes	Awaiting Compliance Review
Risk Reject	Risk Queue — manual decision	Yes	Awaiting Risk Review
Sale Reject	Sales Queue — manual decision	TBC	Awaiting Sales Response
{Safety net for Finance DBR}	System — DBR above threshold	Yes, after the section 6 change	Awaiting Credit Approval
{Fail Strategies Check}	System — failed all segmentations	Yes	Awaiting Credit Approval
Approval Limit Result = "Failed"	System — limit below Min Boundary	Yes	Awaiting Credit Approval
{Pre-Fetch Applicable Product}	System — no applicable product	No	Not applicable
Pre-Dedupe Check	System — pre-dedupe failure	No	Not applicable
AML manual override result	AML screening decision	No	Not applicable

This mapping resolves an important distinction: **failed all segmentations** (revertible) and **no applicable product** (not revertible) are separate rules writing separate audit steps — *{Fail Strategies Check}* and *{Pre-Fetch Applicable Product}* — so the eligibility rule can reliably tell them apart.

6. System change required: DBR routing to Credit Queue

To make credit-driven automatic rejections revertible, the following change to system behaviour is required. This is a change to the **decisioning flow**, not only to the Super Portal, and should be assessed and estimated as such.

The DBR safety net currently terminates the application outright when the threshold is breached. Because the rejection is taken by the system with no queue involvement, there is no previous status for Revert to restore — which is why the routing must change.

Area	Previous Behaviour	New Behaviour
DBR above threshold	The system auto-rejects the application immediately. Application Status = Rejected , Action By = <system> , audit step <i>{Safety net for Finance DBR}</i> . There is no queue involvement and no named decision-maker, so there is no previous status to revert to.	The system routes the application to the Credit Queue . Application Status = Awaiting Credit Approval . The Credit user reviews and either approves / overrides or rejects. If the Credit user rejects, the case becomes revertible under rule R1 .

TBC Terminology — please confirm before build. The agreed scope refers to *"Existing DBR > 50%"*. In the delivered system this safety-net rule is named **Finance DBR** (*"Finance DBR should be <= 50%"*, audit step *{Safety net for Finance DBR}*), while **Existing DBR** is a different defined term used as an input to the DBR Room calculation rather than as a rejection trigger. Please confirm that the rule to be re-routed is the **Finance DBR** safety net.

TBC A companion safety net also exists: **Gross DBR > 100%** (audit step *{Safety net for Gross DBR}*), which likewise auto-rejects. Confirm whether this rule is also to be routed to the Credit Queue, or whether it remains a hard auto-rejection and therefore stays outside Revert.

TBC Confirm whether the DBR threshold remains configurable, and whether the Credit Queue routing change applies to all three products (CC, PL, CASA) or to specific products only.

Two existing behaviours are deliberately **unchanged**, as neither results in a rejection:

- Where no segmentation is configured, or all segmentation criteria are Inactive, the application continues — it is not rejected.
- Where a group has no Min/Max Boundary configured, or the boundary is Inactive, the application is placed into the **Credit Queue** with the missing configuration noted — it is not rejected.

7. Post-revert processing in the receiving queue

- Once an approved revert returns the application to its queue, it is handled by that queue exactly as any other application in that status. No new queue screens or actions are introduced in the receiving queues.
- The Credit user can update the credit parameters available in the Credit Queue — including Other Income, Other Financial Obligations and the Approved Limit — and then approve, override or reject the application again.
- Where the queue user's edit triggers a re-run of the decisioning components — Rule Engine, Income Multiplier and Limit Assignment — the system behaves as per existing implementation. The re-run outcome may return the application to a rejected state; if so, a fresh revert request may be raised under the same rules.

TBC Confirm whether a limit should be placed on the **number of times** a single application may be reverted, or a **time window** beyond which a rejected application can no longer be reverted — for example, no revert after 30 days, or no revert once the customer has submitted a fresh application for the same product.

7.1 Impact on existing messages and notifications

Revert changes an assumption that is currently stated to both bank users and customers: that rejection is final. Three existing behaviours are affected.

Area	Impact
Queue reject confirmation messages	The existing confirmation text tells the user the decision is irreversible. The Compliance confirmation reads <i>"Are you sure you want to Reject this application? This action can not be revert"</i> and the Risk confirmation reads <i>"...The application will be terminated after you reject it!"</i> . Wherever a rejection becomes revertible, this wording is no longer accurate and must be revised.
Customer notification already sent	Rejection already triggers an email to the customer. By the time a revert is approved, the customer has been told the application was rejected. A decision is needed on whether the customer is informed that the case has been reopened.
Reporting and MIS	Reverted applications move out of the Rejected population and back into an in-flight queue status. Any report or dashboard counting rejections needs to reflect that a rejection can now be undone, and over what period. The new <i>User Initiated Revert</i> status must also be classified in reporting.

TBC Confirm the revised wording for the Compliance and Risk reject confirmation messages, and whether the customer should be notified when an application is reopened.

8. Summary

Step	Actor	Action	Application Status	Next Step
1	System or Queue User	Application is rejected — by a Credit, Compliance or Risk user in queue, or automatically by the system on credit grounds	Rejected	Application closed; visible in Application Enquiry
2	Bank User (Maker)	Opens the rejected application in Application Enquiry, clicks 'Revert', enters the Revert Reason and confirms	User Initiated Revert	Application routed to the Revert Queue
3	System	Application dropped into the Revert Queue	User Initiated Revert	Await Checker decision
4a	Checker (Revert Queue)	Clicks 'Approve' and confirms	<Target Status>	Application re-enters the owning queue; email sent to the Maker; application removed from the Revert Queue
4b	Checker (Revert Queue)	Clicks 'Reject' and confirms	Rejected	Email sent to the Maker; application removed from the Revert Queue
4c	System (auto-timeout)	No Checker action within [X] days — request lapses	Rejected	Email sent to the Maker; application removed from the Revert Queue
5	Queue User (Credit / Compliance / Risk)	Reviews the application and updates credit parameters where applicable	<Target Status>	Application re-decisioned; may be approved, overridden or rejected again

Summary of changes:

Areas	Previous Behaviour	New Behaviour
Application Enquiry — action bar	Only the 'Cancel Application' button is available on the Application Details screen.	A new ' Revert ' button is added alongside 'Cancel Application', enabled only for revertible rejected applications.
Role Management — Enquiry module	Application Enquiry sub-module offers the 'Cancel Application' permission.	A new ' Revert Application ' permission is added under the same sub-module.
Role Management — Manually Queue	Termination Queue offers View Application and Evaluate Application.	A new Revert Queue is added with the same two permissions.

Areas	Previous Behaviour	New Behaviour
Queue menu	Termination Queue handles manual cancellation requests.	A new Revert Queue handles manual revert requests.
Application statuses	'User Initiated Cancellation' is the only maker-checker holding status.	A new holding status ' User Initiated Revert ' is introduced.
Rejected applications	A rejected application is final. The customer must submit a new application.	A rejected application can be returned to the queue status held before rejection, subject to Checker approval.
DBR safety net	Auto-rejected by the system with no queue involvement.	Routed to Credit Queue as ' Awaiting Credit Approval ' for a Credit decision.
Failed all segmentations / Approved Limit < Min Boundary	Auto-rejected by the system; final.	Auto-rejected as before, but revertible to 'Awaiting Credit Approval'.
Queue reject confirmation messages	State that the rejection cannot be reverted or that the application will be terminated.	Must be revised wherever the rejection is revertible.
Audit trail	Rejection is the terminal event on the application.	' Manual revert process ' and ' Revert Queue ' events are appended, preserving the original rejection record.
