HISTORY OF CHANGE

Version	Date	Author	Description
1.0	30 September 2026	Hailey (Appro)	Initial version
1.1	1 October 2026	Hailey (Appro)	Head of Retail review (30 Sep) incorporated — employer search-and-select with exception free-text path, matching rules documented, governing requirements stated, clarifications on re-run counter, concurrency, transaction integrity, source hierarchy and downstream consistency

EMPLOYER NAME EDIT IN CREDIT QUEUE

FEATURE OVERVIEW

This document describes the Super Portal capability that allows authorised Credit users to **correct the Employer Name** of an application while it sits in the Credit Queue. Today the Employer Name is system-derived and locked — from the government employment record (sponsor name) or from the customer input — although it drives the employer classification (ALOC), the related company attributes, the Rule Engine evaluation and the maximum DBR used by limit assignment. A wrong employer name today leaves the Credit user only two options: decide the case on non-listed-company terms, or reject it. Key steps are as following:

- Credit user with the 'Edit Employer Name' permission opens the existing Edit Application pop-up in Credit Queue and corrects the Company Name in the Employment Information section (the renamed Length of Service section, now holding both employment fields).
- On save and confirmation, the system overrides the finalized Employer Name, re-runs the employer classification (ALOC and MOD / MOI / Pensioner flags), recalculates the related fields and re-runs the Rule Engine.
- The application details display the updated name, the re-classified result and a full original → updated trail; every downstream consumer of the Employer Name reads the corrected value.

Governing requirements (Head of Retail, 30 Sep 2026): *Employer Name amendment follows a validation-first, exception-based model. A manual amendment does not by itself establish employer eligibility or classification: the system independently validates the amended employer against the approved Empaneled Company List before ALOC, the related variables, eligibility or limit are recalculated. Where validation is successful, processing continues straight through.*

The Employer Name update, employer classification, calculated variables, limit assignment, Rule Engine execution and routing are treated as one controlled transaction: in case of any failure no partial update is committed and the application remains in its last successfully completed state or moves to a controlled recovery status.

Applicable products: **CC, PL**. (CASA is excluded — it has no credit decisioning; Mortgage Loan and Auto Loan are not yet part of the platform scope.)

Product Type	Applicable Status where the Employer Name can be edited
CC	Credit Queue L1 / L2 / L3 — Application Status 'Awaiting Credit Approval'
PL	Credit Queue L1 / L2 / L3 — Application Status 'Awaiting Credit Approval'

The edit shall be restricted in below scenarios:

Scenario	Condition
Application waiting for income verification	The application is pending the income retrigger — Edit is disabled as today.
Application locked by another request	A recalculation or Rule Engine run is in progress — 'The Application is in another request processing.'
User without the permission	'Edit Employer Name' = FALSE — the section is hidden; a role with all Edit permissions FALSE does not see the Edit button.
Application not in Credit Queue	Application Enquiry and the Risk / Compliance / Sale queues remain view only.

END-TO-END EMPLOYER NAME EDIT FLOW FROM SUPER PORTAL

1. Role Management: Edit Employer Name Permission

- A new role permission named **'Edit Employer Name'** shall be added to the Editor group of **Credit Queue L1, L2 and L3** under the Manually Queue section of Role Management — **no product classification**: one permission per queue level, per the live Role Management design — listed **immediately before 'Edit Length of Service'** and with the same treatment.

Manually Queue

Queue Type	Actions
Sale Queue L1	☒ View Application
Sale Queue L2	☒ Delete Document
Sale Queue L3	☒ Re-fetch AECB
Credit Queue L1	☒ Download Individual Credit Report
Credit Queue L2	☒ Edit Liability Info
Credit Queue L3	☒ Send Application
Risk Queue L1	
Risk Queue L2	
Risk Queue L3	
Transaction Posting Queue	
Disbursement Maker	
Disbursement Checker	
Compliance Queue L1	
Compliance Queue L2	
Termination Queue	

Users Management

SC1: Add Role screen: Manually Queue > Credit Queue > 'Edit Employer Name' permission

Permission Value	Allowed Actions
Edit Employer Name = TRUE	Users can view and update the Company Name field of the Employment Information section in the Edit Application pop-up.
Edit Employer Name = FALSE	The Company Name field is hidden (the section is hidden when Edit Length of Service is FALSE too). A role with all Edit permissions FALSE does not see the Edit button.

The permission is a distinct right — never bundled with Evaluate Application or Send Application, and it stays separate from 'Edit Length of Service' although both fields sit in the one Employment Information section: each permission governs its own field. The Permission Matrix reference page shall be updated.

2. Employer Name edit from Credit Queue

- The existing **Edit** button on the Credit Queue Application Details screen is the entry point. In the Edit Application pop-up, the existing "Length of Service" section is renamed **Employment Information** and holds both employment fields — the new **Company Name** followed by **Length Of Service (Months)** (existing, unchanged). Pop-up order: Application Details → Other Income And Expenses → Liability Info → Employment Information.

SC3: Edit Application pop-up — Employment Information section (employer search-and-select; manual entry as exception)

Component	Type	Mandatory	Editable	Description
Employment Information	Section bar	N/A	N/A	Renamed from 'Length of Service' — same style and position. Shown when 'Edit Length of Service' or 'Edit Employer Name' is TRUE; each field displays per its own permission.
Company Name	Input field	Yes	Yes	New field, governed by 'Edit Employer Name'. Pre-populated with the current finalized Employer Name. Validation as the customer journey field: alphabetic characters only; maximum 200 characters; blank not allowed. An unchanged value on Save does not trigger the re-run.
Clear All / Cancel / Save	Existing controls	N/A	N/A	Unchanged behaviour: Clear All reloads the stored values; Cancel closes without saving; Save is disabled until a value changes.

Employer matching rules (as implemented)

Rule	Behaviour
Candidate source	Approved Empaneled Company List — active employers only; inactive records are not matched.
Match method	System matching with a 90% confidence threshold; the selected or typed name is matched against the list — classification is never taken from the typed text itself.
Category rule	Matched employer must carry a category other than NON-ALOC for an ALOC result; otherwise the application remains N-ALOC.
Trade vs legal name, aliases, Arabic names	Matched through the names held in the Empaneled Company List; coverage grows with the Employer Master data (separate governance stream).
Duplicates	Highest-scoring active record wins; the matched employer and score are recorded.
No confident match	Application remains N-ALOC — no favourable classification can result from an unverified employer.

3. Impact of saving the updated Employer Name

When the user clicks Save, the existing Edit confirmation component is shown once for the whole pop-up — one generic message, not specific to any edited field (centered message, No / Yes, Save buttons): *'Are you sure you want to update this <Application ID>? The system will automatically recalculate the related fields and re-run the Rule Engine.'*

SC4: Confirmation before the re-run

On 'Yes, Save', the system executes in order:

#	System action	
1	Override the finalized Employer Name with the input. The first system-derived value is kept as the Original Employer Name together with its original classification. Source is recorded as 'Credit Department' with Updated By / Updated On. The government-record and customer-journey source data are not modified.	
2	Re-run the employer classification: match the new name against the Empaneled Company list — listed company → ALOC with its category, sector, industry and contact fields; otherwise N-ALOC. Re-evaluate the MOD / MOI / Pensioner flags.	
3	Recalculate the calculated variables and the limit assignment — the classification drives the maximum DBR and the income-multiplier group.	
4	Re-run the Rule Engine (segmentation, filtration, deviation) on the currently published versions. The existing shared re-run counter applies — the same rule as every edit action that re-triggers the Rule Engine (Edit Information, Re-fetch ECB, Retrigger FTS): if the application fails the Rule Engine more than 2 times in total, the system rejects it. The counter counts business Rule Engine outcomes only — technical or integration failures are handled by the platform error handling and never consume the counter or reject the customer. Existing platform behaviour, unchanged by this feature.	
5	Route the application per the standard routing logic. The status stays 'Awaiting Credit Approval' unless the routing changes it — no new Application Status, no mobile-app impact.	
6	Audit trail: Step = 'Edit Information'; Step Detail on two lines — line 1: <i>Employer Name: updated from "<old>" (Source: <old source>) to "<new>"</i> — line 2: <i>ALOC: updated from <original ALOC> to <updated ALOC>;</i> Action by = user email. This step is the traceability record — the old → new trail lives in the application history, not in the Application Details display.	
7	Loading screen up to 15 seconds; the application is locked during the run ('The Application is in another request processing.');	two users cannot amend simultaneously and a stale session cannot overwrite a newer update — version validation applies before save. The whole run executes as one controlled transaction: no partial update is committed; on failure the application remains in its last successfully completed state or moves to a controlled recovery status.

#	System action
8	Toaster 'Application "<Application ID>" is updated successfully!'; the Application Details, Rule Engine Result and Approve Limit Result sections reload.

- Several sections edited in one Save → the recalculation and the Rule Engine run once, after all values are stored.
- No cap on repeat edits; the Original Employer Name is set once and never overwritten.

4. Display after the update

The fields below sit in the expanded **Application Details** section > **Employment Information** sub-block of the application view. **Application Details displays details only — no trail block**; the old → new trail lives in the Application Enquiry application history (section 3, step 6). The same section is shown, reading the finalized value, in every view that renders it: **Credit Queue L1–L3, Risk Queue, Sale Queue, Compliance Queue, Termination Queue, Disbursement Maker / Checker and Application Enquiry** (all view only):

SC5: Application Details — Employment Information after the update

Source hierarchy — the four employer values, all preserved, and the one that decides:

Employer value	Held where	Used for
Customer Declared Employer	Customer Journey input — never modified	Record of what the customer declared

Employer value	Held where	Used for
System-derived Original	Kept from the first amendment onward	Reference / audit
Bank Validated Employer (finalized)	The working value, with its source attribute	The credit decision and every downstream consumer
Credit-amended attribution	Source = 'Credit Department' + Updated By / Updated On	Shows who finalized the value

Field	Value after the edit
Company Name	Updated finalized Employer Name — the value the system uses
Company Name Source (new)	EFR (Sponsor Name) Customer Journey Credit Department (after an edit).
ALOC / Pensioner	Re-classified result in the live display format: Yes No (<match %>)

- Repeat edits: every edit writes its own Edit Information step — the application history carries the full trail.
- **Application Enquiry impact:** the enquiry details display the updated values identically in the same Application Details section, and its Application History shows the 'Edit Information' step with the old → new values in the step details, followed by the system steps of the re-run. No edit is possible from Application Enquiry.

The screenshot displays the 'Application Enquiry' interface. On the left is a navigation sidebar. The main content area is titled 'Application Enquiry' and includes a breadcrumb 'Enquiry > Application Enquiry'. Below this is a 'Details' section with application metadata: Application ID (APP_RB_10092600001281), Product Type (CREDIT CARD), Application Status (AWAITING CREDIT APPROVAL), Application Source (APP), Email ID (Khaled.Mohammed@appro.ae), and Phone Number (9752000000). The central part of the interface is a table titled 'Application History' with columns: No, Step, Start Time, End Time, Step Details, Current Application Status, Step Status, and Action By. The table contains several rows, with the first row (No. 12, Step: Edit Information) highlighted with a red border. This row shows the 'Employer Name' being updated from 'AL FUTTAIM PRIVATE COLL' to 'AL FUTTAIM GROUP LLC' and the 'ALOC' being updated from 'No (88.66%)' to 'Yes (95.40%)'. To the right of the table is a sidebar with sections for 'Cross-Application Identifier Match', 'EID' (listing previous applications with the same EID), 'MOBILE_NUMBER' (listing previous applications with the same mobile number), and 'IBAN' (listing previous applications with the same IBAN). At the bottom of the sidebar is a section for 'Approved Credit Information'.

SC6: Application Enquiry — application history with the Edit Information step

5. Downstream consumers of the corrected Employer Name

Rule: after a successful update, every downstream system and document consumes the same finalized Employer Name and classification — no consumer may show or decide on a different employer value. After the edit, every consumer reads the corrected finalized value:

Consumer	Behaviour after the edit
Application details — every view that renders it (Credit / Risk / Sale / Compliance queues, Termination Queue, Disbursement Maker / Checker, Application Enquiry)	Updated name and re-classified ALOC — section 4. No change needed per view: they all read the finalized value.
CAM report + Affordability Assessment Form	Regenerated on the edit, carrying the updated name, classification and recalculated results.
Application Form	Not regenerated — it remains the record of what the customer submitted at OTP time.
Customer Document Stack	Generated after the decision — carries the updated value automatically.
Core banking (CIF creation)	No impact — the CIF mapping carries no Employer Name.
AML screening	No re-screening on the edit; the corrected name reaches the screening system through the post-decision CIF-update call. Treatment to be confirmed by Compliance — confirmed on [date].
Length of Service	Not re-run — it has its own edit section.
Customer communication	None — the customer is not notified of the correction.

6. Summary

Step	Actor	Action	Result
1	Credit User (with permission)	Opens Edit on a Credit Queue application and corrects the Company Name	Save enabled once the value changes
2	Credit User	Confirms the update	System actions of section 3 execute in order
3	System	Overrides the finalized name, re-classifies, recalculates, re-runs the Rule Engine and routes	Status stays 'Awaiting Credit Approval' unless routing changes it
4	System	Refreshes the view and writes the audit trail	Updated details, original → updated trail, history step
5	Credit User	Decides the case on the corrected employer	Approve / override / reject on the true classification

ADDITIONAL IMPACT ANALYSIS

Beyond the direct scope above, the following areas of the Reem Bank platform are impacted and must be carried into estimation and test scope:

Area	Impact	Screen
Role Management / Permission Matrix	New permission 'Edit Employer Name' on Credit Queue L1–L3 (Editor group; one permission per queue level, no product classification). A distinct right, never bundled. Permission Matrix page updated.	 Role Management > Credit Queue (SC1)
Edit Application pop-up	New Employment Information section: Company Name as search-and-select over the Empaneled Company List, free-text entry as exception (flagged for review); customer-journey validation on free text.	 Edit Application > Employment Information (SC3)
Employer classification	The classification step becomes re-runnable on demand for one application with a user-provided name; it overwrites the previous results atomically.	 Confirmation before the re-run (SC4)
Rule Engine & Limit Assignment	Re-run on the new classification against the currently published versions; shared re-run counter; recalculation of calculated variables and approved limit.	 Rule Engine — published strategies
Application Details display	Company Name Source row on every view rendering the section (queues including Termination / Disbursement, Application Enquiry); classification fields refreshed. No trail block — the trail is in the application history only.	 Application Details > Employment Information (SC5)
Audit trail	'Edit Information' step with a dynamic old → new step detail; the re-run steps log with Action by = System.	 Application history (SC6)
