ECB Consumer Credit Score 3.0

Rule Engine and Score Check Management — Super Portal

V1.0 / 25 September 2026

Prepared for Reem Bank

Appro Onboarding Solutions FZ-LLC · Credit Bureau & Decisioning

Confidential document between Appro Onboarding Solutions FZ-LLC and the recipient institution — not to be shared outside both organizations.

Information reflects Appro's reading of the Etihad Credit Bureau specification at the date of publication. Not legal or regulatory advice.

1. FEATURE OVERVIEW

Etihad Credit Bureau replaces Consumer Credit Score 2.1 with **Consumer Credit Score 3.0**. Score 3.0 is not a version bump: it splits the scored population in two, each with its own scorecard, its own scale and its own range codes — **Mature** (300 – 850, codes M0–M9) and **New to Credit** (300 – 650, codes N0–N9).

The bureau has confirmed **no change to the A2A request format or to connectivity**. The response is enriched, not restructured. Nothing in the current Super Portal integration breaks. What changes is the vocabulary the credit policy is written in — and that is what this document specifies.

What is delivered

- A single, backend-configurable **Score Range master** holds every range code. Adding, editing or deactivating a range needs no code change and no deployment.
- **Segment detection** derives Mature or New to Credit from the returned range by exact match against that master — never by reading the first character.
- The **AECB Score Range** criterion in the Rule Engine offers the Score 3.0 codes in addition to the existing families; nothing already published is retired or remapped.
- A new **AECB Score Segment** variable is added to Segmentation, Filtration and Deviation, so a strategy can tell the two populations apart.
- **AECB Score Range** and **AECB Score Segment** become attributes in Score Check Management, alongside the existing numeric score.
- The application enquiry banner, the queues and the credit report display the range **code and description** plus the segment.

End-to-end flow

Green = start · blue = portal step · amber = system-derived value · purple = end

How a Score 3.0 response reaches a credit decision

2. SCOPE

Product scope

Rule Engine Strategies (Segmentation, Filtration and Deviation), Score Check Management, the application enquiry banner and the credit report — for the products where Score Check Management is enabled: **Credit Card, Personal Loan and CASA**. The Mortgage Loan and Auto Loan tabs are disabled in the current build and are out of scope.

In-scope scenarios

1. **S1** — A Credit user selects an AECB Score Range value on a Strategy criterion and is offered the Score 3.0 codes.
2. **S2** — A Credit user builds a rule on the new AECB Score Segment variable.
3. **S3** — A Credit user adds an AECB Score Range condition to a Score Check Management value set.
4. **S4** — An application returns a Score 3.0 range; segment, code and description are derived, displayed and evaluated.
5. **S5** — An application returns an existing family range code; behaviour is unchanged.
6. **S6** — A range is added, edited or deactivated in the master after go-live, with no code change and no deployment.

Not in scope

- Any change to the bureau request or response contract.
- Any change to Limit Assignment boundaries or deviation thresholds.
- Mortgage Loan and Auto Loan, whose Score Check Management tabs are disabled.
- The bank's own cut-offs, tier mapping and policy tables. Appro configures what the bank decides; the decisions themselves sit with Credit and Risk.

3. THE SCORE RANGE MASTER

Every range code the platform recognises lives in one master. Each entry carries the range code, its risk group, its descriptive band, the segment or score name it belongs to, the minimum and maximum score of the band, and an active flag.

Range codes are never hard-coded in service logic. Every consumer — the Rule Engine, Score Check Management, the enquiry banner, the queues and the report — reads this master. Adding, editing or deactivating a range is a configuration change, not a release.

The bureau's own bands are reproduced below. Both segments are fully contiguous: every score inside a segment's scale resolves to exactly one code, with no gaps and no overlaps.

Segment	Code	Risk group	Band	Min score	Max score
Mature	M0	Very High Risk	Weak	300	300
Mature	M1	Very High Risk	Weak	301	523
Mature	M2	High Risk	Fair	524	673
Mature	M3	Medium Risk	Good	674	714
Mature	M4	Medium Risk	Good	715	740
Mature	M5	Medium Risk	Good	741	755
Mature	M6	Low Risk	Very Good	756	773
Mature	M7	Low Risk	Very Good	774	789
Mature	M8	Very Low Risk	Excellent	790	809
Mature	M9	Very Low Risk	Excellent	810	850
New to Credit	N0	Very High Risk	Weak	300	427
New to Credit	N1	Very High Risk	Weak	428	450
New to Credit	N2	High Risk	Fair	451	463
New to Credit	N3	High Risk	Fair	464	478
New to Credit	N4	High Risk	Fair	479	491
New to Credit	N5	Medium Risk	Good	492	506
New to Credit	N6	Medium Risk	Good	507	519
New to Credit	N7	Low Risk	Very Good	520	531
New to Credit	N8	Low Risk	Very Good	532	553
New to Credit	N9	Low Risk	Very Good	554	650

Consumer Score 3.0 — day-one values loaded into the Score Range master

Existing families are retained, unchanged in meaning. The range codes in use today are migrated into the same master so that all codes live in one place. They keep their present risk groups and remain selectable, and no strategy version that references them is affected. The enumerated list of existing codes is taken from the current production configuration and confirmed before build; it is not assumed.

4. SEGMENT DETECTION

The application's score segment is derived from the range returned in the bureau response, by **exact match against the Score Range master**.

Returned range	Segment / score name
Two characters, M + digit (M0–M9)	Consumer Score 3.0 — Mature
Two characters, N + digit (N0–N9)	Consumer Score 3.0 — New to Credit
Any existing family code	Its current score name — unchanged

Prefix matching is prohibited. Score Range is a fixed two-character field, but the codes in use today occupy a single character. A single-character **M** is a Very Low Risk code in the existing families, while **M0–M9** is the Mature segment. A rule, a report filter, a warehouse column or a policy table that tests only the first character will classify a Very Low Risk customer as Mature, or will truncate and silently fail to join. This is the first item on Appro's watch-list in the Q3 2026 newsletter, and the reason the master is matched on the whole code.

The derived segment is persisted on the application, so the banner, the reports and the audit trail all read the same value. A range that is not found in the master does not resolve to a segment: it is handled as **no value**, and is never defaulted to the lowest band.

5. RULE ENGINE — SCORE RANGE VALUE LIST

The AECB Score Range criterion is sourced from the Score Range master, so it offers the Score 3.0 codes **in addition to** the existing families — not in place of them.

- Operators are unchanged: **Is In, Is Not In, Include, Does Not Include, Is Empty, Is Not Empty.**
- Strategy versions published before this change keep working untouched, because no existing code is retired or remapped. **No migration of published versions is required.**
- A code deactivated in the master stops being offered on new or edited strategies, but does not break a version that already references it.

The screenshot shows a configuration interface for a strategy criterion. On the left, there is a text input field labeled "Length of service (months)" with a value of "Hailey". Below it, there is a button labeled "AECB Score Range" and a dropdown menu. The dropdown menu is open, showing a list of risk levels: "M6 - Low Risk", "M7 - Low Risk", "M8 - Very Low Risk", "M9 - Very Low Risk" (highlighted), "N0 - Very High Risk", "N1 - Very High Risk", and "N2 - High Risk". To the right of the dropdown, there is a radio button labeled "Match All Conditions". Below the dropdown, there is a text input field labeled "Select value" with a search icon. At the bottom, there is a button labeled "+ Add criteria".

Strategy criterion — the value list with the Score 3.0 codes available

6. RULE ENGINE — SCORE SEGMENT VARIABLE

A new variable is added to Segmentation, Filtration and Deviation.

Field	Operators	Values
AECB Score Segment	Is In, Is Not In, Include, Does Not Include, Is Empty, Is Not Empty	Mature / New to Credit

Why the variable is needed. The two scorecards do not share a scale, so the same three digits carry opposite verdicts. A score of 600 is **High Risk** on the Mature scorecard (tranche M2, band 524–673) and **Low Risk** on New to Credit (tranche N9, band 554–650). A single policy table keyed on the numeric score alone treats those two customers identically. They are not the same risk. Every score-dependent rule must read Segment alongside Score, or key off the range code, which is already segment-safe.

The screenshot shows a rule configuration interface. At the top, a customer name 'Hailey' is displayed. Below it, a dropdown menu for 'AECB Score Segment' is open, showing two options: 'Mature' and 'New to Credit'. The operator 'Is in' is selected, and the value field contains 'Select value'. To the right, the 'Match All Conditions' radio button is selected. At the bottom, there is a '+ Add criteria' button.

1 New criterion — AECB Score Segment replaces AECB Score Range on this rule. 2 Its only values are the two Score 3.0 segments.

Strategy criterion — the new AECB Score Segment variable and its two values

7. SCORE CHECK MANAGEMENT

AECB Score Range becomes an attribute in Score Check Management, alongside the existing numeric **AECB Score**, on the Credit Card, Personal Loan and CASA tabs. **AECB Score Segment** is available on the same terms.

- Usable in a group's Values conditions under Match All / Match Any, on the same footing as the existing attributes.
- Operators as section 5.
- Added through Edit Attributes, so the attribute reaches every group on the product tab.
- Existing groups and value sets are unchanged, and the numeric score condition keeps working.

Score Check Management — a value set conditioned on the Score 3.0 codes

8. ENQUIRY, QUEUES AND THE CREDIT REPORT

The same banner component serves **Application Enquiry**, **Credit Queue detail** and **Termination Queue detail**. All three reflect the change, and each is verified separately before sign-off.

Score Name

Consumer Score 3.0 – Mature

CHANGED

Score block — the range code and description, and the new segment

Credit report

In the Credit Summary block, below the credit score, the report displays **Score Range = code – description** as text, for example “M9 – Excellent”. The star display follows the segment’s own scale.

Stars	Mature	New to Credit	Equivalent risk group
1	300 – 523	300 – 450	Very High Risk
2	524 – 673	451 – 491	High Risk
3	674 – 755	492 – 519	Medium Risk
4	756 – 789	520 – 650	Low Risk
5	790 – 850	NA	Very Low Risk

The star bands align exactly with the risk groups held on the master, so the star count is derived from the risk group rather than from a second hard-coded band table. **New to Credit has no five-star band**, because the scale has no Very Low Risk code — see section 10.

9. RELEASE PLAN

Milestone	Date	Owner
Build available in UAT	26 September 2026	Appro
UAT verification	From 26 September 2026	Reem Bank and Expleo
Bureau go-live — Consumer Score 3.0 in production	27 September 2026 (tentative, bureau-set)	Etihad Credit Bureau
Production deployment of this change	After bureau go-live, once UAT verification is complete	Appro
Updated data points and upgraded report format	October release	Appro

Sequencing. The production deployment follows the bureau go-live. Releasing ahead of it would put Score 3.0 codes in front of credit users while the bureau is still returning Score 2.1 values.

Production impact today: none. With the Rule Engine configured as it is now and the bureau response structured as it is now, this change does not alter any live decision. It adds codes, one variable and two attributes; it retires nothing and remaps nothing.

Where the impact lands: credit policy setup. The new calibration, the new score ranges and the second scorecard change the way cut-offs, tiers and eligibility rules have to be written. A Score 2.1 threshold carried forward unchanged will not produce the approval rate the bank expects. That work is the bank's, and it is the reason the platform change is delivered ahead of the bureau date.

10. IMPACT ANALYSIS

Area	Impact	Screen
Rule Engine — Strategies	The value list is sourced from the master and extended with twenty codes across Segmentation, Filtration and Deviation. Published versions keep working unchanged; nothing is retired or remapped.	
Rule Engine — new variable	AECB Score Segment is added as a variable with two values. Without it a strategy cannot distinguish the two populations, whose scales end 200 points apart.	
Score Check Management	Two new attributes on the Credit Card, Personal Loan and CASA tabs. Existing groups and value sets are unchanged and the numeric score condition keeps working.	
Credit policy and cut-offs	Granularity moves to ten codes per segment, so an application can fall on a different side of a threshold than before. A shared numeric threshold over-approves one population and over-declines the other. Published strategies are re-validated before go-live.	
New-to-Credit applicants	The scale ends at 650 and the top code N9 is Low Risk — there is no Excellent / Very Low Risk code and no five-star band. Any criterion selecting Very Low Risk, and any numeric threshold above 650, can never be met by a New-to-Credit applicant. Existing thresholds are reviewed against this.	
Enquiry, reporting and audit	Every surface that carries the score displays the code, the description and the segment. Historical applications keep the value they were decisioned under. The score step records the range code, the description and the segment.	

11. OPEN QUESTIONS

Each item below has a recommended default. Confirming the defaults is enough to proceed.

#	Question	Recommended default
1	Are the existing range codes in the current production configuration confirmed for migration into the master, with their present risk groups?	Enumerate from the live configuration and confirm before build. No code is assumed.
2	How are New-to-Credit applicants treated in policy — the same cut-off table, a separate table, or refer?	A separate table. One shared table mis-decisions one of the two populations.
3	Which existing criteria select Very Low Risk, or test a numeric threshold above 650?	Reviewed before go-live. Under Score 3.0 no New-to-Credit applicant can satisfy either.
4	Should a range that is absent from the master block the decision, or pass through as no value?	Pass through as no value, never defaulted to the lowest band, and recorded on the audit trail.
5	Which downstream reports carry the score range and need the code, description and segment?	Enumerated with the bank and confirmed during UAT.
